## 0.3 Preface

All operator panels have been developed to meet the requirements of user interface communication. The product offers integrated functions such as text display and text control, dynamic display, time channels and alarm and recipe management.

This manual describes the installation of the operator panel.

# 1 Safety Instructions

The installer and owner and/or operator of the operator terminal must read and understand this installation manual.

1

## 1.1 General

- Read the Safety Instructions carefully.
- Check the goods immediately on delivery for any damage during transit. Inform the supplier immediately if any damage is detected.
- Do not use the operator panel in explosive atmospheres.
- The supplier accepts no liability for equipment that has been modified, changed or adapted.
- The only replacement parts and accessories permitted are those manufactured in accordance with the supplier's specifications.
- Read the Instructions for Installation and Use carefully before installing, using or repairing the operator panel.
- Fluids, metal filings or pieces of wire must not be allowed to fall into the openings of the operator panel under any circumstances, as this could cause fire or electric shocks.
- The operator panel should only be used by qualified staff.
- If the operator panel is located in an environment where the temperature is either lower or higher than the values recommended in this manual, the liquid crystals in the display may freeze or become isotropic (liquid).
- The LCD contains a liquid which is a strong irritant. Rinse any areas of skin that come into contact with this liquid with plenty of water. If the substance enters your eyes, keep your eyes open, rinse thoroughly with water and consult a doctor.
- The illustrations in this manual are for explanatory purposes. As a specific installation is influenced by numerous factors, the supplier cannot guarantee that actual practice will match the illustrations.
- Nor can the supplier guarantee that the operator panel will be suitable for your particular application. No form of liability may be accepted for your product design, installation or operation.
- You are recommended to switch the operator panel off and restart it at least once before any components/cards are installed, or before the operator panel is connected to external devices, e.g., serial devices.

## 1.2 Installation instructions

- The operator panel is designed for installation on a fixed site on a flat surface, and subject to the following conditions:
  - There is no substantial risk of explosion.
  - There are no strong magnetic fields.
  - There is no direct exposure to sunlight.
  - No large or sudden variations in temperature will occur.
- Install the product as described in the attached Installation Instructions.
- Earth the product as described in the attached Installation Instructions.
- The operator panel should only be installed by qualified staff.
- High voltage, signal and power-supply cables must be kept separate from each other.
- Ensure that the voltage and polarity of the power source are correct before connecting the product to the power supply.
- The peripheral equipment must be suitable for the installation location and the intended purpose.

1

## 1.3 Operation

- Keep the operator panel clean.
- The emergency switch and other safety functions must not be controlled from the operator panel.
- Do not use excessive force and do not use any pointed or sharp items when operating the keys, display, etc.

## 1.4 Service and Maintenance

- Repairs should only be carried out by trained expert personnel.
- Guarantee rights are defined for each specific contract.
- Shut off the power supply to the equipment before carrying out any cleaning or maintenance work.
- Clean the display and the surrounding front cover with a soft cloth and a mild cleaning agent.
- A battery installed the wrong way round may create a risk of explosion. Only use the batteries that have been recommended by the supplier.
- The unit can be restarted using the reset switch located behind the fan.

## 1.5 Removal and Disposal

- Full or partial recycling of the operator panel must be carried out in accordance with the applicable regulations in force.
- Bear in mind that the following components contain substances that may endanger health and the environment: Lithium battery, electrolytic condensers and screen.

1

## 1.6 Air in the Touchscreen Monitor

- The layered construction of the touchscreen monitor contains air, and in rare cases air bubbles may be visible. This purely aesthetic display will have no effect whatsoever on the correct functioning of the operator panel. This optical effect may occur under certain combinations of environmental factors such as temperature, humidity and atmospheric pressure.

## 2 Installation

### 2.1 Space Requirements

- Maximum thickness of the installation plate: 8 mm
- Space required in millimetres for installation of the operator panel:

2

#### PCD7.D6210WTI010

Note:  
The diagram and dimensions are not drawn to scale.

Warning: The openings in the casing enable air circulation and must not be covered.

## 2.2 Installation Procedure

The following is required:

- A Torx TX7 screwdriver

1. Unpack the components supplied and check that they are all present. Inform the supplier of any damage that has occurred.

Note: Place the operator panel on a stable surface during installation. The operator panel may be damaged if it is dropped.

2. Use the cut-out dimensions in the overview drawing in the section operator panel drawings and in the technical data sheet to cut the correct size of opening in the cabinet.
3. Mount the operator panel in its installed position using M4 Torx screws and fix the integrated clamps tightly against the operator panel.

4. Connect the cables in the sequence indicated (see drawing and steps in sequence below).

Warning:

- Ensure that the operator panel and controls share the same electrical earth (reference potential) to avoid communication errors.
- The operator panel must be stored at ambient temperature before start-up. If there is a risk of condensation forming, make sure the operator panel is dry before connecting to the mains power.
- Check that the voltage and polarity of the power supply are correct.
- Use shielded communication cables only.
- High voltage cables must be kept separate from the signal and supply circuits.

2

- Connect cable A.
- Connect cable B. To do this, use an M5 screw and an earth conductor (as short as possible) with a minimum cross section of 2.5 mm<sup>2</sup>.
- Connect cable C.
- Connect cable D. The recommended cable cross section is 1.5 mm<sup>2</sup>.

5. Carefully remove the plastic film from the operator panel display to avoid damage from static electricity.

### 2.2.1 Connections to the Controller

You can find more information about the cables connecting the operator panel and the controller(s) in the help file for the relevant driver.

### 2.2.2 Other Connections and Peripheral Devices

Cables, peripheral equipment and accessories must be designed to suit the application and the existing environmental conditions. Your supplier can provide you with more information and recommendations.

## 3 Replacing Hardware

This section provides information on how to replace the hardware elements of the operator panel. When doing this, only use components and materials included in the latest version of the parts list.

### 3.1 Replacing Fans and Filters

3

The following is required:

- A new fan
- A Torx TX10 and a TX20 screwdriver

Note: Take the necessary ESD prevention measures.

Proceed as follows when changing fans and fan filters.

1. Switch off the operator panel.
2. Unscrew the two M3x6 Torx screws and remove the fan cover.

3. Remove the fan filter.

3

4. Unscrew the two M4x35 Torx screws and remove the fan.

3

5. Replace the fan and filter in the reverse sequence. Tighten the fan screws up to a maximum torque of 0.4 Nm.

## 3.2 Replacing the 2.5" SATA Mass Storage

The following is required:

- A new 2.5" SATA mass storage device
- A Torx TX10 screwdriver

Note: Take the necessary ESD prevention measures.

3

When changing the 2.5" SATA mass storage device proceed as follows:

1. Switch off the operator panel.
2. Remove the eight M3x8 Torx screws from the rear panel and remove the front frame.

Warning: When dismantling, it is important to pay attention to the cable connecting the front and rear parts. When pulling the cable out, ensure that the cable is returned to the correct position when reassembling.

Note: Electronic components should only be replaced by experienced trained technicians. Incorrect handling of electrical components or the wrong connection of a cable may cause the equipment to be destroyed.

3. Unscrew the four M3x4 Torx screws from the two hard disk mountings. Remove the two hard disk mountings.
4. Unscrew the two M3x6 Torx screws that hold the CPU boards in place.

5. Detach the hard disk from the hard disk connection on the CPU board.

**3**

6. Repeat the steps in reverse order with the new hard disk.

1. 2.5-inch SATA mass storage device
2. Compact Flash card slot
3. CFast card slot

### 3.3 Replacing a CompactFlash or a CFast Memory Card

The following is required:

- A new CompactFlash or CFast memory card
- A TX10 Torx screwdriver

Note: Take the necessary ESD prevention measures.

3

This is how you replace a memory card:

1. Switch off the operator panel.
2. Follow the instructions in the Chapter “Replacing the 2.5” SATA mass storage device” to remove the front frame unit.
3. Install the new memory card in the slot provided (see illustration below).

1. 2.5-inch SATA mass storage device
2. Compact Flash card slot
3. CFast card slot

4. Repeat the steps in reverse order.

### 3.4 Replacing the Battery

The following is required:

- A new battery of type BR2032 (or CR2032).
- A Torx screwdriver

Note: Take the necessary ESD prevention measures.

3

This is how you replace the battery:

1. Switch off the operator panel.
2. Follow the instructions in the chapter “Replacing fans and filters” to remove the fan and access the battery.
3. Replace the battery.
4. Repeat the steps in reverse order.

## 4 Technical Data

Parameters	PCD7.D6210WTI010
Front cover, W×H×D	556 × 347 × 87 mm
Cut-out dimensions, W×H	539 × 331 mm
Installation depth	79 mm (179 mm including clearance)
Individual mountings	VESA 100 × 100 Note: The maximum screw length for the VESA fitting is 5.5 mm. The use of longer screws may cause damage.
Front cover protection class	IP 65
Rear side protection class	IP 20
Material for touch display	Polyester on glass, resistant coating: Autotex F157 or F207 <sup>(1)</sup> .
Touchscreen contacts:	1 million touchscreen contacts
Protective material on the rear side	Powder-coated aluminium
Frame material	Powder-coated aluminium
Weight	8.1 kg
Serial connection for COM1 RS-232 and COM2 RS-485	9-pin D sub-connection using RS-232 RTS/CTS, fitted socket with standard fixing screws 4-40 UNC.
Serial connection for COM3 RS-232 and COM4 RS-485	9-pin D sub-connection using RS-232 RTS/CTS, fitted socket with standard fixing screws 4-40 UNC.
Ethernet	2 × 10/100/1000 Base-T (shielded RJ45)
USB	4 × USB Host 2.0, max. output current 500 mA
Processor	Intel®Core™ i7 2715QE (4 × 2.1 GHz) (Turbo 2.0, Hyper-Threading), 6 MBL2Cache, QM67Chipset
External storage media	via USB
RAM	4 GB DDR-3 SO-DIMM 1333 MHz
LED	1 × Multicolour
Real-time clock	Yes (on chip)
Battery	Lithium battery type BR 2032 (or CR 2032), replaceable
Electrical consumption at nominal voltage	125 W
Fuse	10A
Power supply	DC input range: 18-32 VDC (140 W) ATX standard CE: The power supply must comply with IEC 60950 and IEC 61558-2-4. UL and cUL: The power must be supplied under the conditions for power supply Class II.

Display	TFT-LCD with backlit LED. 1920 × 1080 pixels, 16.7 million colours.
VGA	1 × VGA: Max. resolution 2048 × 1536@75 Hz
DVI	1 × DVI-D single connection: Max. resolution 1600 × 1200 or 1920 × 1200 (with reduced blanking)
Active display area, W×H	476.64 × 268.11 mm
Operating temperature	0°C – +50°C
Storage temperature	-20°C – +70°C
Relative humidity	5% – 85% non-condensing
Approvals and certifications	Information is available at <a href="http://www.sbc-support.com">www.sbc-support.com</a>

<sup>(1)</sup> You will find more information in the section “Chemical resistance”.

## 5 Resistance to Chemicals

### 5.1 Metal Casings

Frames and casings are made from powder-coated aluminium. This powder coating resists the impact of the following chemicals without any visible effects:

Acetic acid 10%	Phosphoric acid 10%
Citric acid 10%	Sea water
Diesel	Sodium chloride 20%
Distilled water	Sulphuric acid 20%
Edible oils	Tap water
Heating oil	Hydrogen peroxide 3%

5

The powder coating partially resists the effect of the following chemicals at room temperature:

Butanol	Nitric acid 10%
Hydrochloric acid 5%	Phosphoric acid 43%
Isopropyl alcohol	Turpentine
Sodium hypochlorite 10%	

Note: If contact with one of the above chemicals is unavoidable, it is advisable to test the effect of the substance prior to use on a part of the metal casing that is not highly visible.

The powder coating does not resist or barely resists the effect of the following chemicals at room temperature:

Concentrated acetic acid	Methyl ethyl ketone	Toluene
Acetone	Nitric acid 30%	Trichlorethylene
Ammoniac 5%	Phenol	Xylene
Concentrated ammoniac	Sodium hydroxide 30%	Petrol, 97 octane, unleaded
Ethyl acetate		Petrol, 98 octane, leaded

## 5.2 Touch Display and Coating

### 5.2.1 Autotex F157/207

Autotex F157 or F207 covers the coating surrounding the touch display.

#### Resistance to solvents

In accordance with DIN 42115 part 2, Autotex F157/F207 is resistant to the following chemicals for more than 24 hours without displaying visible effects:

Acetonitrile	Diesel Downey / Lenor <sup>(1)</sup>	Phosphoric acid (<30%)
Dissolved scouring powder (Ajax/Vim)	Ethanol	Potassium ferrocyanide/ ferricyanide
Alkaline carbonate solution <sup>(1)</sup>	Glycerine	Potassium hydroxide (<30%)
Ammoniac (<40%) <sup>(1)</sup>	Glycol	Pure turpentine
Acetic acid (<50%)	Gumption <sup>(1)</sup>	SBP 60/95 <sup>(1)</sup>
Dissolved Ariel powder <sup>(1)</sup>	Hydrochloric acid (<36%)	Sulphuric acid (<10%)
Bleach <sup>(1)</sup>	Linseed oil	Tomato ketchup
Castor oil	Methanol	Trichloroacetic acid (<50%)
Sodium hydroxide (<40%) <sup>(1)</sup>	Nitric acid (<10%)	White spirit
Drilling oil	Paraffin oil	Windex <sup>(1)</sup>
Cyclohexanol	Dissolved Persil powder <sup>(1)</sup>	Wisk
Diacetone alcohol	White spirit <sup>(1)</sup>	-

<sup>(1)</sup> An extremely faint shine was observed on the structure.

In accordance with DIN 42115 part 2, Autotex is resistant for maximum 1 hour to glacial acetic acid without displaying visible effects.

Autotex is not resistant to high pressure steam at over 100°C or to the following chemicals:

Concentrated inorganic acids	Benzyl alcohol
Concentrated etching solution	Methylene chloride

## 5.2.2 Touch Display Surface

The surface of the touch display on the operator panel is resistant to the following solvents without displaying visible effects:

Solvent	Time
Acetone	10 min
Isopropanol	10 min
Toluene	5 hrs

## 5.2.3 Autotex

The use of the Autoflex EBA180L touchscreen protective film is recommended.

### Resistance to solvents

Autoflex EBA180L resists the effects of the same chemicals as Autotex F157 or F207 pursuant to the section on Autoflex F157/207.

### Use outdoors

Similar to all polyester-based films, Autoflex EBA 180L must not be exposed to direct sunlight for a prolonged period of time.

## 6 Operator Panel Diagrams

### 6.1 Connections

Pos.	Connection	Description
1	DVI	External monitor
2	VGA	External monitor
3	COM 1/2	Communications connections
4	COM 3/4	Communications connections
5	LAN (connection B)	1 × 10/100/1000 Base-T (shielded RJ-45); Intel 82574
6	LAN (connection A)	1 × 10/100/1000 Base-T (shielded RJ-45); Intel 82559
7	USB	2 × USB Host 2.0, max. output current 500 mA
8	USB	2 × USB Host 2.0, max. output current 500 mA
9	Power supply	DC input range: 18-32 VDC (140W) ATX standard

6

### 6.2 Communications Connections

Pin	Serial connection, 9-pin socket		Serial connection, 9-pin socket	
	COM1	COM2	COM3	COM4
1	-	RS-485 Tx+/Rx+	-	RS-485 Tx+/Rx+
2	RS-232 RxD	-	RS-232 RxD	-
3	RS-232 TxD	-	RS-232 TxD	-
4	-	-	-	-
5	GND	GND	GND	GND
6	-	RS-485 Tx-/Rx-	-	RS-485 Tx-/Rx-
7	RS-232 RTS	-	-	RS-422 RTS+
8	RS-232 CTS	-	-	RS-422 RTS-
9	-	-	-	-

Note: The RS422 interface is not yet available

Note: A Y splitter cable CAB109 is required to run two communications ports on the same physical connection.

### 6.3 PCD7.D6210WTI010 Overview

6

Note: A Step CAD file is available on the website at [www.sbc-support.com](http://www.sbc-support.com)

## 7 Additional Installation Instructions

Please follow the recommendations below if communication problems occur, for example in environments with interference or at temperatures close to the limits.

### 7.1 Earthing the Operator Panel

The fixing clamps for the operator panel do not provide a safe earth connection between the panel and the equipment cabinet; see 1 in the above diagram.

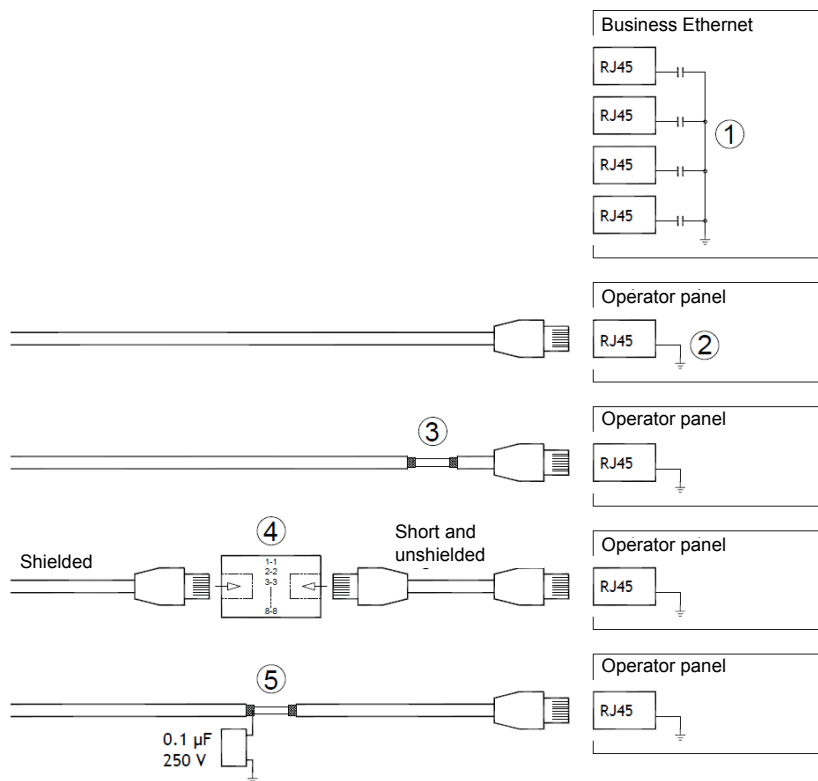

1. Connect a 2.5 mm<sup>2</sup> cable between the quick-connect socket and the operator panel casing; see 2 in the above diagram.
2. Connect a 6 mm<sup>2</sup> or 4 mm<sup>2</sup> cable or an earth strap between the housing of the operator panel and the nearest earth point on the door; see 3 in the above diagram.
3. Attach a strong but short earthing braid between the door and the equipment cabinet; see 4 in the above diagram.
4. Twist the cable and insert it into the 24 VDC supply; see 5 in the above diagram. The minimum cross section for the cable is 2.5 mm<sup>2</sup>.  
Two turns around the ferrite core will provide four times the suppression of a single turn.  
Three turns around the ferrite core will provide nine times the suppression of a single turn.

A ferrite core suppresses interference to the 24 V power supply; see 6 in the above diagram.

Note: The earth wires must be short and have a large cross section. A long, thin earth wire will have very high impedance (resistance) at high frequencies and will not earth interference. Multi-core cables are preferable to single core with the same cross section. A braided cable with the same cross section is even better. The ideal solution is a short but strong earthing braid.

## 7.2 Ethernet Connection in the Operator Panel

In some industrial business Ethernet installations the shielding of the RJ45 connection is attached to the casing via a condenser; see 1 in the above diagram.

The Ethernet shielding for the operator panel is connected directly to the casing; see 2 in the above diagram.

1. Check if the shielding for the other Ethernet entity is earthed directly or via a condenser.

Note: In many cases it is not recommended to connect both ends of shielded Ethernet cables to the casing. This could cause humming or an earth loop. Unshielded cable could incur even fewer communication errors.

One solution is to use a shielded Ethernet cable, the shielding of which is connected at one end only. Another option is to remove the shielding; see 3 in the above diagram.

A more elegant solution is to extend the shielded Ethernet cable with a length of unshielded Ethernet cable; see 4 in the above diagram.

You can earth the shielding using a 0.1- $\mu$ F/250-V external plastic condenser; see 5 in the above diagram. This connects the high frequency fluctuations to earth.

### 7.3 Improved EMC Protection

- First use the original cable supplied with the device or use a
- shielded cable for RS-232 communications.
- For RS-422 and RS-485 communications use a twisted-pair cable and a shielded cable.
- Use the appropriate cable for each type of bus: Ethernet, Profibus, CC-Link, CAN, DeviceNet, etc.
- Carry out the installation and connections in accordance with the specification that applies to the relevant bus standard.
- Use shielded Ethernet cable, if possible with foil and a braid shield.
- The shielding for the D-sub connector must be connected all the way round (360°) the connector housing.
- Connect the shielding at both ends.

With longer distances there is a risk of a difference in the ground potential. In this case, the shielding should be connected at one end only. Alternatively, the other end of the shielding may be earthed using a 0.1-μF/250-V plastic condenser. If subjected to HF, both ends must be earthed and one end only for LF to avoid 50/60-Hz earth loops.

1. Use an EMC cable connector or a normal plastic cable connector, remove the outer sleeve and attach the shielding to the installation plate using a 360° metal cable clamp.

- Place the 24 VDC and communication cable in one channel and the 230/380 VAC cable in a different one. If you have to cross the cables, only do so at 90°.

Avoid combining cables for stronger 24 VDC outputs with the communication cable.

Ferrite cores connected to the shielded cables can be used to suppress minor interference. Large pieces of ferrite connected to unshielded cables in locations where the wires can be wrapped two to four times around the core are 5 to 25 times more effective.

## 7.4 Ambient temperature

The maximum ambient temperature for the operator panel is listed in the specifications. The ambient temperature refers to the temperature in the equipment cabinet which cools the electronic elements of the operator panel.

7

In most cases the ambient temperature for the operator panel is significantly higher than the ambient temperature for the equipment cabinet. If the cabinet is large and contains several pieces of equipment that generate heat, the temperature in the upper part of the cabinet will be noticeably higher than the theoretically anticipated rise in temperature. All electronic components are sensitive to heat. The service life of an electrolytic condenser is reduced by 50% with an increase in temperature of 8 to 10°C. A rise in temperature of 15 to 20°C reduces its service life by 75%, etc.

Rittal offers a practical program for estimating the likely average temperature in the cabinet and also a program to control the temperature in the equipment cabinet.

An enamelled steel cabinet produces a radiation heat value of 5.5 W/m<sup>2</sup> and °C.

The temperature can be balanced by installing a fan in the cabinet, as circulating air has a considerably greater cooling effect compared to static air.

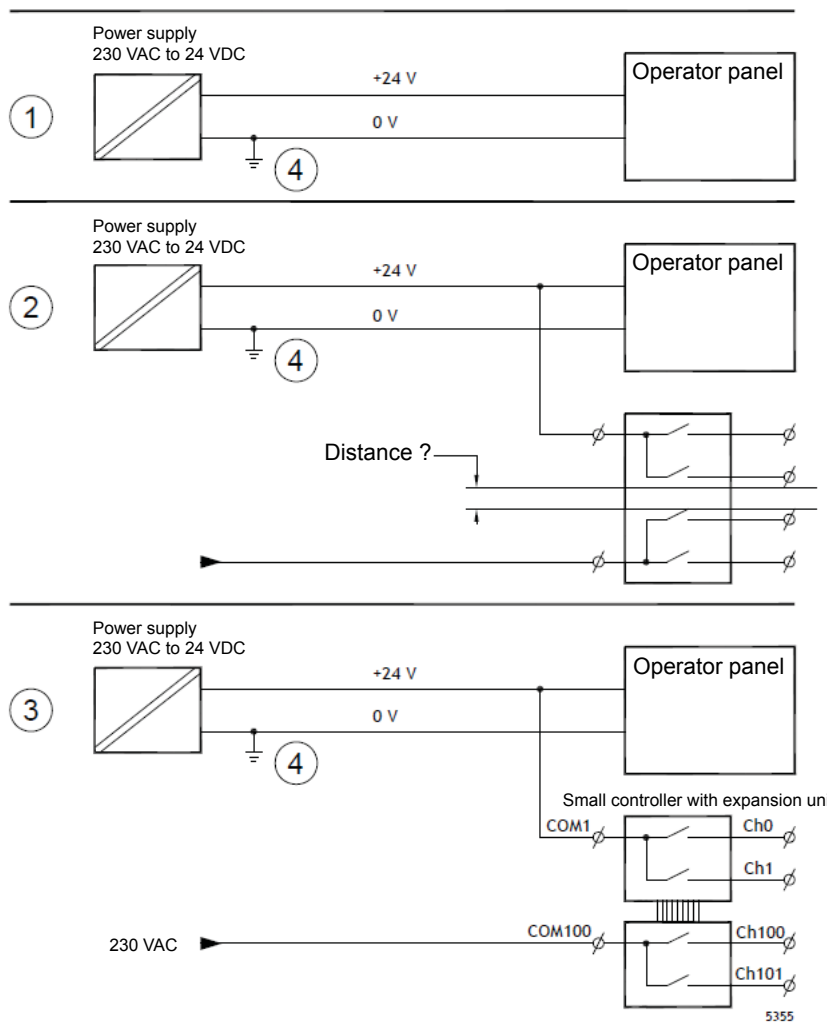

Install the fan in the cooler area to blow cold air onto the operator panel. If the fan is mounted at the top and sucks warm air upwards, the operating temperature of the fan itself will be increased, thus reducing its service life.

The power dissipation of the operator panel equals the power supply voltage multiplied by the current. In practice, no current flows to external consumers and the inputs do not incur a power loss.

### 7.5 Safety

Most operator panels are supplied with 24 VDC.

7

No problems will arise if you install a power supply that meets the safety standards and supplies the operator panel only. See 1 in the above diagram.

However, if you are using a 24-V unit that also supplies other units you must take the appropriate measures; see 2 in the above diagram. The operator panel does not have insulation as required by the safety requirements in the event of a short circuit between 230 VAC and 24 VDC. It is assumed that providing 24-V power is safer, e.g. SELV in accordance with EN60950 (protection from electric shocks) and UL950.

Example:

the following example explains why a safe 24-VDC supply may be disrupted if a 24-VDC relay contact is combined with a 230-VAC relay contact in a small controller. Make sure that the distances and the creepage distance between 24 VDC and 230 VAC comply with EN60950 or UL950. If this is not the case, supply the operator panel with its own 24-V unit.

If there is an adequate distance between the relay contacts for 24 VDC and 230 VAC, the same 24-V unit can be used to supply all components. See 3 in the above diagram.

7

Connect 0 V to the 24-V unit with the earth. This has three advantages:

- Increased safety. The 24-V supply is not live if there is a faulty connection or a short circuit between 0 V (24 V) and the 230-V phase.
- Fluctuations in the 24-V supply are earthed.
- There is no risk of the 24-V supply showing a high value compared to earth. This is not unusual owing to the presence of high static electricity.

## 7.6 Cable and Bus RS-485 Terminals

- Shielded, twisted-pair cables must be used to exploit the maximum transmission distance and the maximum transmission speed. The mutual capacitance must not exceed 52.5 pF/m and the cable cross section must be at least 0.25 mm<sup>2</sup> (AWG24).
- 0 V, the reference voltage for communications, should be in the cables. Install two pairs for bi-directional communication: one for the communication and one for 0 V.
- The shielding must be earthed at one end. The other end would normally also be earthed. Over longer distances, or with a difference in the earth potential, the shielding should be earthed using a 0.1-μF/250-V plastic condenser to avoid earth current along the shielding braid. Some manufacturers recommend earthing the shielding at each node. Different manufacturers offer different systems for the end of the bus.

Depending on the receiver construction, the bus cables may be on a single level or require pull-up or pull-down resistors to avoid false signals being recognised when the bus is in sleep mode (when all transmission units are off).

**7**

## 7.7 Boot Sequence

The boot sequence is the sequence in which the hardware storage devices are read.

If F7 is pressed during the boot process, a drop-down menu will appear displaying all the available bootable devices.

The boot sequence can only be changed temporarily. At the next start up the boot sequence will revert to the works setting.

## 7.8 Calling up the BIOS

**Beware:** The BIOS settings for this program should only be changed by computer technicians. Certain changes could result in the failure of your operator panel to function correctly.

**Note:** Before making changes to the BIOS setup you should note the setup information for future reference.

**Note:** You are recommended to switch the operator panel off and restart it at least once before any components/cards are installed or before the operator panel is connected to external devices, e.g., serial devices.

1. Connect a USB keyboard.
2. Switch on the power supply and switch the operator panel on.
3. During the boot process press the F2 key immediately after initialisation of the keyboard. The initialisation is displayed in the LEDs on the keyboard.

If F2 is pressed before the keyboard is initialised, pressing the key will have no effect.

If you wait too long and the logo for the operating system is displayed, wait a little longer until the desktop of the operating system appears. Now switch the operator panel off and try again.

**Note:** The key used to call up the BIOS setup may vary in different models and CPU boards. It is generally one of the following keys: ESC, DEL, F1 or F2. You can find more information in the BIOS manual.

System setup allows you to:

- Change the system configuration (newly installed hardware).
- Define boot devices and sequences.
- Set up or change user options such as passwords.
- Read the installed storage and environmental parameters such as the CPU temperature.

You can find more information in the BIOS manual.

## 7.9 Reset Switch

The reset switch is located under the fan cover.

Information on how to remove the fan cover to access the reset switch is contained in the chapter “Replacing fans and filters”.

## A Annex

### A.1 Icons

This symbol indicates that this manual, a different manual or technical documents contain more information on this topic. There are no direct links to these documents.

This symbol indicates instructions that require strict compliance.

This symbol warns the reader that touching components may lead to damage from electrostatic discharge. Recommendation: touch at least the system's negative terminal (PGU port casing) before coming into contact with the electronic components. A more effective solution is to wear an earthed strap on your wrist connected to the system's negative terminal.

The explanations next to this symbol are valid for the Saia PCD® classic series only.

The explanations next to this symbol are valid for the Saia PCD® xx7 series only.
